by [Ali Alzahmi](#) - Monday, 19 May 2025, 7:40 PM

My participation in this week's discussion on computing ethics in digital health allowed me to consider the relationship between technology and social responsibility regarding compliance in healthcare. I began by discussing Corazón, a medical technology company that introduced significant technical changes while maintaining a strong approach to ethics. Corazón developed advanced implantable heart monitors and ensured patients' privacy by adhering to ethical principles and essential regulations, such as the GDPR (Birkett et al., 2023). This highlighted the use of the ACM and BCS codes of conduct, underscoring the principles underlying ethics in business and society, particularly in the context of profit-driven firms.

The comments from my teachers allowed me to learn more. I found Fahad insights on how Corazón applies ethical strategies beneficial for setting examples for other companies. After Regalado (2024) and Baltazar-Sabbah (2025) mentioned ethical practices in healthcare technology, I recognised that this is important for patients and for building a solid reputation in digital health, especially for underserved populations (Dehankar & Das, 2025). For that reason, it is necessary to earn the public's trust to make them feel safer about using connected health technologies.

Fahad discussed Corazón's actions by referencing the BCS Code of Conduct, highlighting the benefits for society, the ability to practice professionally, and the importance of keeping data safe. Luttmner et al. emphasised that having active laws and economic systems is essential when incorporating social responsibility into innovative efforts. This led me to pay more attention to how companies can encourage responsible innovation through ongoing education, addressing moral issues, and involving various stakeholders in decision-making (Van Speybroeck et al., 2021).

It was most apparent that meeting only the technical goals of an assignment is not enough to make computing ethical. This encompasses the entire field of social good, law, and accountability. As a result, others learned that merging business success with social responsibility is possible when a company applies declared ethical principles in every aspect of product and service delivery.

It has helped me realise that the codes of ethics by the ACM and BCS influence businesses to act both for profit and for the benefit of the community (Voegtlin et al., 2022). I am now considering using ethical computing practices in my studies and job-related tasks to support fairer use of technology.

They explain that ethics in the pharmaceutical and medical fields can have significant impacts on people's well-being. I find that it is crucial to explore how technology should be used correctly in multiple fields, especially in healthcare. I now understand that ethical computing aims to support both creativity and the good of the community. In my view, the development and design of new technologies should always help increase faith in digital and computer technology.
