Summary Post

by [Ali Alzahmi](#) - Monday, 7 July 2025, 8:49 PM

In my post, I explored the strong ethical and practical concerns of large language models (LLMs), including GPT-3. These models are fantastic in generating human-like text, yet they do not know anything and depend on statistical patterns. This weakness is devastating in sensitive areas like healthcare, where misinformation can be fatal. Omiye et al. (2024) also emphasize that, although LLMs may be helpful in medical documentation and diagnosis, they would reinforce damaging effects unless controlled. I also touched upon the problem of algorithmic bias, whereby GPT-3 has had to learn biases present in society (racial and gender stereotypes, etc.), due to training solely on readily available data on the internet. Abburi et al. (2023) state that bias mitigation should be systematic and ongoing. Also, I investigated the dangers of AI tools in education, particularly writing. Critical thinking and creativity can be poorly supported by the automation of creativity in AI (Anson & Straume, 2022).

Its random nature, dependent on the wording of queries, contributes to the danger. Prompt programming makes it very difficult to maintain consistency and reliability, especially in high-stakes situations. I concluded that strong regulation, user education, and regular monitoring should be introduced to create AI-based language tools to prevent their misuse and establish credibility.

These points were supported to some extent by peer replies. Ali Yousef Ebrahim Mohammed Alshehhi commended the analytical writing, especially the section discussing AI's dangers in healthcare and education. He proposed that digital literacy in the curriculum may deal with these risks. One concern Fahad raised in AI-related governance issues is the necessity of transparency and model audits. Ana-Maria Stoica has made a fair argument about the fatality assertion in healthcare, which contains a more tempered position, citing the recent findings on GPT-3 diagnostic precision.

The discussion highlights the importance of managing closely, disclosing, and inducing AI literacy in education to assess the competent application of AI technologies.
